

There are 7 continents in the world, and 5 oceans.
Let's look at them!

This is a compass. A compass is a device that shows direction. It is an important device for navigation. It helps us to navigate earth. A compass works by using the Earth's natural magnetic fields.

A compass points out directions, such as North (N), South (S), East (E) West (W). These are also known as the cardinal directions.

There are also little measurements around the compass, called degrees. The red part of the needle always points North, and the white /black end always points South.
